## 3. Nicotine and Consistency Test

Method: According to Afnor XP D90-300-3:2021 Annex A.3, wipe the clamp with isopropyl alcohol. Let stand for a minute. The aerosol produced by the e-cigarette is absorbed by the Cambridge filter. Remove the Cambridge filter and place it into a centrifuge tube, add 20 mL of Isopropyl alcohol and 0.2mL internal standard stock solution. Shaken at 210 rpm for 30 min, and the solution was filtered and analyzed by GC-FID.

Tested Series	Series 1*	Series 3*	Series 5*	AVG		
Value	ND	ND	ND	ND	-	-
Deviation (%)	0.0	0.0	0.0	-	-	-

- Note:
- mcg = microgram
  - mg = milligram
  - ND = Not Detected (lower than LOD)
  - LOD = Limit of Detection =1.45 mcg/mg
  - LOQ = Limit of Quantitation = 4.35 mcg/mg
  - 1 series = 20puffs
  - \* Values used for determination of consistency of nicotine emission
  - Under the conditions of the test and with reference to AFNOR XP D90-300-3:2021, the electronic cigarette delivers a dose of nicotine at consistent levels.
  - “mcg/mg”, the amount of each test item in “mcg” obtained by instrument analysis dividing the mass of vaporized liquid of 20 puffs in “mg” obtained by weighing.
  - <sup>△</sup> Nicotine content of liquid is tested with reference to Afnor XP D90-300-2:2021 Annex A.4, with the LOQ of 0.0005 mg/mL, is involved in the calculation of entrapment efficiency.
  - The entrapment efficiency is calculated as the ratio between the amount of nicotine measured in the emissions and the amount of nicotine theoretically vaporized. Theoretically vaporized nicotine is determined from the mass of liquid vaporized and the nicotine content in the liquid.
